The NICE guideline "Hypertension in Adults: Diagnosis and Management" outlines recommendations for diagnosing and managing hypertension in adults over 18, including those with type 2 diabetes. It emphasizes accurate blood pressure measurement, recommending ambulatory or home monitoring to confirm diagnosis. Cardiovascular risk and target organ damage should be assessed, considering age, lifestyle, and other conditions. Initial treatment focuses on lifestyle changes such as diet, exercise, and smoking cessation, with medication advised for stage 1 hypertension at high cardiovascular risk or stage 2 hypertension. Regular monitoring and treatment adjustments are recommended to maintain target blood pressure levels, with specific guidance for people over 80 and those with additional conditions like diabetes or kidney disease. The guideline aims to reduce risks of heart attack, stroke, and other complications, supporting evidence-based treatment decisions in clinical practice.
